Water Operator, John Sablan, measures chlorine at a sample tap. Every day, water operators check several sites throughout the CUC Tinian water system to ensure that all areas have the proper amount of chlorine.

2018 CUC TINIAN WATER QUALITY REPORT

This report is designed to inform you about the water CUC delivers to you, our customer. Our goal is to provide you and your family a safe and dependable supply of drinking water.

Today, 100% of Tinian water customers enjoy 24-hour water service. Our CUC water employees continue to strive to deliver a quality product to all of our customers and to protect the CNMI's water resources.

To ensure the safety of your water, CUC routinely monitors for contaminants in your drinking water according to CNMI Bureau of Environmental and Coastal Quality (BECQ) and the United States Environmental Protection Agency (EPA) laws, rules, and regulations.

Each year, trained laboratory and water treatment specialists conduct or supervise more than 1,000 tests on Tinian water samples. Water quality samples are collected throughout the CUC Tinian water systems and tested regularly. Samples include untreated and treated water taken from our facilities, sample sites throughout the service areas, and at customers' homes.

Except where indicated otherwise, this water quality report is based on the results of CUC's monitoring for the period of January 1, 2018 to December 31, 2018. Any results reported before January 1, 2018, and presented here, are from the most recent monitoring period.

Peter Taitano, CUC Rota (bottom), Ralph Ascano, CUC Saipan (middle), and Mike Benavente, Guam Waterworks Authority (top) work together to remove rocks under an 8-inch waterline. CUC thanks the many operators from our neighbor islands of Rota and Guam who helped CUC Saipan and Tinian restore water services after Super Typhoon Yutu.

A Message from the CUC Executive Director

Welcome to Commonwealth Utilities Corporation's (CUC's) Annual Water Quality Report. Each year we produce this report to update our customers and the community on the quality of the drinking water we supply throughout our service areas. Due to the low levels of some chemical elements, CUC is allowed to monitor for these compounds on a less frequent basis; for example, we test for lead and copper once every three years.

Our corporate strategy is to be an exceptional service provider offering 24-hour water that puts customers first and benefits the community. Safe, high quality drinking water is a life-giving resource; its provision contributes to community health and hygiene. We strive to deliver our services in a reliable and affordable way that is accessible to everyone in our community. Our service area is growing and encompasses Saipan, Tinian, and Rota.

We supply water to our customers via an extensive, largely underground network of over 400 miles of water mains, as well as associated valves, holding tanks, pumping stations, and secondary disinfection plants. Our priority as an exceptional service provider is to manage and operate this network so that our customers continue to reliably receive the quality, safe drinking water they expect.

The information presented in this report explains the sources of our drinking water, how it is treated so that it is safe to consume without further treatment, and demonstrates in detail how the quality consistently meets primary drinking water quality standards such as bacterial contaminants. We verify the quality of the drinking water supply via a comprehensive monitoring program that also allows us to identify potential improvements to benefit our customers and community.

I am pleased to report that this independent chemical and microbial testing continues to demonstrate that the quality of our drinking water supply meets EPA standards as established by the Safe Drinking Water Act (SDWA) of 1974 and associated regulations that are periodically revised. Details of the testing and the results form a major part of this report.

Further to monitoring the supplied water quality, we also rely upon feedback from customers to advise us of local issues that may arise. Such feedback is recorded as water quality related customer complaints.

Our drinking water quality management processes are endorsed through an uninterrupted history of successfully retaining drinking water certification and compliance as required by the SDWA.

CUC is committed to continue to providing high quality, safe drinking water to all our customers and community. I am confident that you will find the information contained in this report helpful to better understanding the quality of our drinking water supply.

Gary P. Camacho, Executive Director

The Sources of CUC Tinian Water

The primary source of water for the island of Tinian is one Maui-type well. To control bacterial contamination in our water, the CUC operates one chlorine treatment station.

Every day, CUC water operators measure and adjust the trace amounts of chlorine added to the water before it goes into the water lines to you, our customer.

House of Taga, Tinian

How Drinking Water Becomes Contaminated

The sources of drinking water both tap water and bottled water, include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals, and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- ▶ Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- ▶ Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm-water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- ▶ Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses.

- ▶ Organic chemical contaminants, including synthetic volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm-water runoff, and septic systems.
- ▶ Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that your tap water is safe to drink, the US EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the **EPA's Safe Drinking Water Hotline** at (800) 426-4791 or on the internet at www.epa.gov/safewater/.

For People with Sensitive Immune Systems

Some people may be more vulnerable to contaminants in drinking water than the general population.

Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplant, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from health care providers. The US EPA and the Centers for Disease Control guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available at the **EPA's Safe Drinking Water Hotline** at (800) 426-4791 or via the internet at www.epa.gov/safewater/.

Information About Nitrates

Nitrate in drinking water at levels above 10 ppm is a health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity. If you are caring for an infant, you should ask for advice from your health care provider. CUC tests the water in Tinian at least once per year. The amount of nitrates in all CUC water is below the health effect level.

For more information about your water quality, please call our Water Laboratory at (670) 322-5140.

Bacterial Contaminants

Total Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially-harmful, bacteria may be present. While not disease-causing organisms themselves, total coliforms are often found in association with other microbes that are capable of causing disease. Coliform bacteria are more persistent than many disease-causing organisms; therefore, their absence from water is a good indication that the water is free from microbial contaminants and safe for human consumption.

To control the presence of microbial contaminants in our water systems, the Commonwealth Utilities Corporation operates one chlorine treatment station on Tinian. Bacteria may occur in the CUC water when the treatment equipment fails, or when leaks occur in the CUC pipelines allowing ground contaminants to enter the pipes.

When problems were detected in 2018, the CUC water operators repaired leaks, flushed the water lines or when needed, added extra chlorine to the reservoirs and pumping stations, and therefore, the public did not have to use alternate water.

Information About Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Commonwealth Utilities Corporation is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, **you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using the water for drinking or cooking.**

If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the **Safe Drinking Water Hotline** at **(800) 426-4791** or at www.epa.gov/safewater/lead.

EPA requires testing for lead and copper at customers' taps that are most likely to contain lead and copper.

We thank our customers for their help in collecting these samples!

None of the sites tested exceeded the action level for lead or copper.

Secondary Water Constituents

NOT ASSOCIATED WITH ADVERSE HEALTH EFFECTS

Many constituents, such as calcium or chlorides, which are often found in drinking water, can cause taste, color, and odor problems. The taste and odor constituents are called secondary constituents and are not regulated by the US EPA or the CNMI Bureau of Environmental and Coastal Quality (BECQ). **These constituents are not causes for health concern.** While secondary constituents are not required to be reported in this document, they may greatly affect the appearance and taste of your water.

Hardness is a measure of the amount of calcium and magnesium compounds in the water. Chlorides measure the amount of salts in the water. The amount of chlorides in the CUC Tinian water is within the EPA recommended level.

Commonwealth Utilities Corporation

SUMMARY OF PRIMARY DRINKING WATER QUALITY RESULTS FOR 2018

PWS ID: MP0000002

TINIAN

Microbiological Contaminant	TT	TT Goal	Year Tested	Number of Positive Samples in Month		Violation?	Major Source of Contaminant
Coliform Bacteria	No more than 1	Zero	2018	More than 1 positive sample triggers Level 1 Assessment 1 positive sample in January and December		NO	Naturally present in the environment
Disinfection Residual	MRDL	MRDLG	Year Tested	Highest Running Annual Average	Range	Violation?	Major Source of Contaminant
Chlorine (ppm)	4	4	2018	1.3	0.3 - 2.2	NO	Disinfection additive used to control microbes
Disinfection By-Products	MCL	MCLG	Year Tested	Highest Running Annual Average	Range	Violation?	Major Source of Contaminant
Haloacetic Acids (HAA5)							
Locational Running Annual Average (ppb)	60	NA	2018	3.3	3.3	NO	By-product of drinking water disinfection
Total Trihalomethanes (TTHM)							
Locational Running Annual Average (ppb)	80	NA	2018	11	11	NO	By-product of drinking water disinfection
Inorganic and Radiological Contaminants	MCL	MCLG	Year Tested	Highest Result	Range	Violation?	Major Source of Contaminant
Inorganics							
Barium (ppb)	2,000	2,000	2016	3.1	3.1	NO	Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits
Chromium, Total (ppb)	100	100	2016	1.6	1.6	NO	Discharge from steel and pulp mills; erosion of natural deposits
Fluoride (ppb)	4,000	4,000	2016	110	110	NO	Erosion of natural deposits
Nitrates + Nitrites as Nitrogen (ppm)	10	10	2018	3.7	3.7	NO	Runoff from fertilizer; leaking septic tanks; sewage; erosion from natural deposits
Sodium (ppm)	NE	NE	2016	94	94	NA	Erosion from natural deposits; sea water
Radiological							
Combined Radium (pCi/L)	5	Zero	2016	1.1	1.1	NO	Erosion of natural deposits
Gross alpha particle (pCi/L)	15	Zero	2016	4.3	4.3	NO	Erosion of natural deposits
Lead and Copper at Customer Taps	Action Level	Action Level Goal	Year Tested	Sites Exceeding AL/ Number of Sites	90th Percentile	Violation?	Major Source of Contaminant
Lead (ppb)	15	Zero	2016	0 / 20	1.6	NO	Corrosion of household plumbing systems and erosion of natural deposits
Copper (ppb)	1,300	1,300	2016	0 / 20	34	NO	

SUMMARY OF SECONDARY DRINKING WATER QUALITY RESULTS FOR 2018

Compound	Secondary Standard	Year Tested	Average Result	Range	Violation?	What This Compound Measures
Chloride (ppm)	250	2018	176	176	NA	Measure of several naturally occurring salts in water
Hardness, Total as Calcium & Magnesium (ppm)	NA	2018	302	302	NA	Hardness is the sum of the many forms of naturally occurring calcium and magnesium compounds
pH	6.5 to 8.5	2017	7.3	6.9 - 7.8	NA	Measure of acidity or alkalinity of water
Specific Conductance (µS/cm)	NA	2017	1128	1,089 - 1,167	NA	Measures how well water conducts electricity depending on amount of dissolved ions
Total Dissolved Solids (ppm)	500	2018	604	604	NA	Measure of naturally occurring salts and minerals dissolved in water

NA: Not Applicable NE: None Established

MEASUREMENTS

Contaminants are measured in:

ppm:	Parts Per Million or milligrams per Liter (mg/L)
ppb:	Parts Per Billion or micrograms per Liter (µg/L)
pCi/L:	Pico Curie Per Liter - a measurement of radioactivity in water
µS/cm:	Micro Siemens Per Centimeter - a measurement of a solution's ability to conduct electricity

HOW MUCH IS ONE PART PER MILLION?

ONE PART PER MILLION IS THE SAME AS:

1 second in 12 days
1 penny in \$10,000
7 drops of water in a bathtub

HOW MUCH IS ONE PART PER BILLION?

ONE PART PER BILLION IS THE SAME AS:

1 second in 32 years
1 penny in \$10 Million
1 drop of water in a swimming pool

DEFINITIONS

MCL: Maximum Contaminant Level

The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

MCLG: Maximum Contaminant Level Goal

The level of a contaminant in drinking water below which there is no known or expected risks to your health. The MCLG amount allows for a margin of safety.

MRDL: Maximum Residual Disinfectant Level

The highest level of a disinfectant allowed in drinking water. There is evidence that addition of a disinfectant is necessary for control of microbial contaminants.

MRDLG: Maximum Residual Disinfectant Level Goal

The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination.

TT: Treatment Technique

A required process or method intended to reduce the level of a contaminant in drinking water.

AL: Action Level

The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that the utility must follow.

Level 1 Assessment:

A Level 1 assessment is a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found our water system.

PAY YOUR CUC BILL ONLINE OR BY PHONE

Save time and money by paying your CUC bill online or by phone! You can pay with your Visa or MasterCard debit or credit card.

Register your account for online payments at www.cucgov.org
For payment by phone, please call
(855) 729-2282.

DO YOU HAVE A QUESTION? Call CUC at (670) 664-4282

For information about your water quality or to find out about opportunities to participate in public meetings, please contact our 24-hour Call Center at
(670) 664-4282.

What is a Water Quality Report?

Here is your annual Water Quality Report. It is about the water supplied by the Commonwealth Utilities Corporation. In 1996, the U.S. Congress amended the Safe Drinking Water Act and now requires that the CUC, your “Community Water System,” publish this report each July. **This report contains important**

information about your drinking water. Speak with someone who understands it or who can translate it.

We hope you read about the source of your water, the levels of detected contaminants, why our water is so different from village to village, and what is being done to correct or improve water services in the CNMI.

As consumers become better informed, they become involved and make better decisions about our environment, how money is spent, and our options in water utility management.

If you need the report translated, wish to speak with someone about the report, or would like a paper copy delivered or emailed to you, please call CUC at (670) 664-4282.
